Bluetooth RGBW Controller

Getting Started

1. Make sure your controller is powered. You will need 12 volts and ground. The red indicator LED on the controller will illuminate when correctly powered.
2. On your device, make sure Bluetooth is switched on.
3. You may need to turn your device's location services on.
4. Open the app. When powered, your controller should appear within 5 seconds.
5. Allow any permissions requested. The app needs permissions to save your custom modes, read colors through your camera, and use your mic to sync to music.

Trouble Connecting

1. Make sure the device is powered. The red indicator LED on the controller will illuminate when correctly powered. If you're not sure about your power source, carefully hold input leads directly to your vehicle battery to test.
2. Make sure your location services and Bluetooth is switched on.
3. If you still don't see the controller, and you are sure it is powered, try resetting it, by disconnecting power and reconnecting.
4. Try restarting your device, and reconnecting.
5. In open air, the controller should work from over 100 feet away. This will be reduced when going through walls, or if the controller is mounted behind metal body panels. If you find that the signal is weak, try repositioning the controller.

Using the Controller

COLOR The main menu! Press anywhere on the wheel, or directly in the middle for TRUE WHITE. You can also adjust brightness using the slider, or tap the R-G-B 0-255 readout to dial in an exact color. When you find something you like, press and hold one of the square Preset buttons on the bottom of the window. You can save up to five static colors, to easily access any time.

PATTERN Easily access a number of preloaded patterns. Speed can be adjusted too. Don't see what you want? Head to the next tab to create your own!

CUSTOM Click Add Mode, and create your own pattern. You can choose colors, speed, and mode to create the exact look you want. Save the mode, pick a custom name, and you can come back to it any time!

SYNC This is a basic function that will flash the lights to any outside noise. Adjust the sensitivity of your mic. To sync to music directly from your device, click your device's Home button, then load a music player. The app will hear the sound directly from your speaker, and sync it up!

CAMERA This fun feature allows you to point your camera at anything colorful, and the controller will try to match the color. Vibrant colors work best!

Using Multiple Controllers
Have more than one controller? You can Group them together, to control them together or independently. Up to four controllers can be connected and controlled at a time. On the main menu, click Add Group, and choose a name. Then tap and hold a controller, and select Add to Group. Repeat to create more groups, or add more controllers to a group.
